

Children's car seats involved in an accident

DATE/DATE

We confirm that our children's car seats must be replaced after an accident. The forces of a collision, even in low speed, can damage the construction and the materials. These damages may be invisible, but nevertheless of such a kind that they may prevent the car seat from functioning optimally.

In the case of an impact the harness stretches 10 – 15 %, which means that the energy absorbing ability of the harness is critically reduced. The lock of the harness can also be damaged.

The ECE 4404 regulation, paragraph 14.3.7 requires that it be stated in the instruction manual that the seat should be replaced after an accident.

HTS Besafe provides no guarantee or product liability for seats that are used after having been involved in an accident.
